Welcome to Avegabros OJT 2026

The Mission:

To master professional web development using a real-world server environment.

The Infrastructure (Raspberry Pi 5)

Hardware: Raspberry Pi 5 (8GB) with Active Cooling.

Power: Official 27W USB-C (High Stability).

Network:

- **Office:** pi5.local (Local LAN)
- **Remote:** Tailscale Mesh VPN (Permanent IP)

Care Rule: Do not place objects on the Pi; it needs airflow to keep your code running!

The "Avegabros" Tech Stack

FRONTEND:
NEXT.JS & TAILWIND CSS

BACKEND:
EXPRESS.JS & NODE.JS

DATABASE:
POSTGRESQL (RELATIONAL) & REDIS (CACHING)

ORM:
PRISMA (DATABASE BRIDGE)

INFRASTRUCTURE:
DOCKER & DOCKER COMPOSE (CONTAINERIZATION)

MONITORING:
COCKPIT & PORTAINER

Credentials & Access

Action Required:

Change your passwords immediately!

Username:

[FirstInitial][Surname]
(e.g., mcaya, rarnado)

SSH & Cockpit Initial Password:

ojt@2026

Note: Linux will force a change on your first SSH login.

Portainer UI Initial Password:

intern@2026

Note: Change this manually in your Portainer Profile settings.

The Port Table

Intern	Next.js	Express	Prisma	Intern	Next.js	Express	Prisma
mcaya	3001	4001	5001	**jolasiman**	3008	4008	5008
aarsolon	3002	4002	5002	**scases**	3009	4009	5009
asabang	3003	4003	5003	**kvalenzuela**	3010	4010	5010
manoos	3004	4004	5004	**gmendaro**	3011	4011	5011
dbibat	3005	4005	5005	**jtaoy**	3012	4012	5012
krosacena	3006	4006	5006	**ncabahug**	3013	4013	5013
hcanales	3007	4007	5007	**rarnado**	3014	4014	5014

Development Workflow

How we write code at Avegabros

Environment:

Connect via **VS Code Remote - SSH** to username@pi5.local.

Versioning:

All code is hosted on GitHub under the avegabros Org.

Local Dev:

Run your apps inside **Docker containers**.

Mirroring:

Group projects are mirrored to our internal **Gitea** server automatically.

VS Code Setup (Your IDE)

"Don't code in the terminal. Use a professional IDE."

Install VS Code on your own laptop.

Install Extension: Look for **"Remote - SSH"** by Microsoft in the Extensions Marketplace.

Connect:

- Press F1 or Ctrl+Shift+P.
- Type Remote-SSH: Connect to Host...
- Enter: username@pi5.local (e.g., mcaya@pi5.local).

Work: Once connected, you can open your home folder on the Pi. It works exactly like a local folder!

Management Dashboards

Save these URLs in your bookmarks:

System Dashboard (Cockpit):

- *https://pi5.local:9090*
- *Monitor CPU/RAM usage of the server.*

Docker Manager (Portainer):

- *https://pi5.local:9443*
- *Manage your containers and view logs.*

Database Viewer (Prisma Studio):

- *http://pi5.local:[Your_50xx_Port]*
- *View and edit your database tables in the browser.*

Task Tracking (The Kanban Board)

"If it isn't on the board, it doesn't exist."

Platform: We use **GitHub Projects** within the Avegabros Organization.

The Workflow:

- **To Do:** Tasks assigned by the Mentor. Pick a task and move it to "In Progress."
- **In Progress:** You are actively writing code for this task.
- **Review:** Once you push your code, open a **Pull Request (PR)**.

The Magic Command: In your PR description, type closes #12 (replace 12 with your task's Issue number).

Automation: This command automatically moves your card to **Review** and notifies the Mentor.

Digital Progress Log (GitHub Issues)

Standardizing your Daily Reports

The Template: Every morning, go to the avegabros repo and create a new **Issue**.

Select: "Daily Stand-up Log."

Mandatory Sections:

- **Accomplishments:** What did you finish yesterday? (Link your PRs).
- **Today's Goals:** What is your #1 priority?
- **Blockers:** What is stopping you? (Hardware, Logic, Access?).

Deadline: This must be submitted **before 1:00 PM** every day.

Daily Stand-ups & Progress Logs

The Meeting:	1:00 PM Sharp after launch.
The Format:	15 minutes. 3 questions: What did I finish yesterday? What am I doing today? What are my **Blockers**?
The Digital Log:	Before 1:00 PM, create a **GitHub Issue** using the "Daily Stand-up" template in the repo.

Performance Evaluation (Grading)

How your success will be measured:

System Discipline (25%):

- Stick to your ports! Do not crash the Pi by leaving zombie processes or violating the sudo policy.

Technical Growth (25%):

- Mastering the stack (Next.js, Express, Prisma). How well can you translate a requirement into working code?

Git & Workflow (20%):

- Meaningful commits and PRs. Moving your cards on the Kanban board and linking them to Issues.

Communication (20%):

- Submitting your **Stand-up Log** before 1 PM and reporting blockers clearly.

Code Quality (10%):

- Clean code that follows our naming conventions and passes linting

Working From Home (Tailscale)

Security

- We will not use public IPs. We use Tailscale.

Setup

- Install Tailscale on your personal laptop.
- Click the **Invite Link** found in your Terminal Dashboard (MOTD).
- Use the **Tailscale IP** to connect via SSH from home.

House Rules & Best Practices

Resource Awareness

We share 8GB RAM. Stop your containers (docker compose down) when not in use.

Git Discipline

Commit/Push at least twice a day.

Security

Never share passwords; protect your SSH key.

Ownership

You are responsible for your assigned port range.

Day 1 Mission Checklist

[ ] Send GitHub username and Email to Viber.

[ ] SSH into the Pi and change your password.

[ ] Join the **avegabros** GitHub Org.

[ ] Fork the ojt-starter-template.

[ ] Update your docker-compose.yml with your **unique ports**.

[ ] Create your first **"Daily Stand-up" Issue** on GitHub.
